
LM149

Wide Band Decompensated \((A_V (\text{MIN}) = 5)\)

**General Description**

The LM148 series is a true quad 741. It consists of four independent, high gain, internally compensated, low power operational amplifiers which have been designed to provide functional characteristics identical to those of the familiar 741 operational amplifier. In addition the total supply current for all four amplifiers is comparable to the supply current of a single 741 type op amp. Other features include input offset currents and input bias current which are much less than those of a standard 741. Also, excellent isolation between amplifiers has been achieved by independently biasing each amplifier and using layout techniques which minimize thermal coupling. The LM149 series has the same features as the LM148 plus a gain bandwidth product of 4 MHz at a gain of 5 or greater.

The LM148 can be used anywhere multiple 741 or 1558 type amplifiers are being used and in applications where amplifier matching or high packing density is required. For lower power refer to LF444.

**Features**

- 741 op amp operating characteristics
- Class AB output stage — no crossover distortion
- Pin compatible with the LM124
- Overload protection for inputs and outputs
- Low supply current drain: 0.6 mA/Amplifier
- Low input offset voltage: 1 mV
- Low input offset current: 4 nA
- Low input bias current: 30 nA
- High degree of isolation between amplifiers: 120 dB
- Gain bandwidth product
  - LM148 (unity gain): 1.0 MHz
  - LM149 \((A_V \geq 5)\): 4 MHz

</tbody>
</table>

Note 1: Any of the amplifier outputs can be shorted to ground indefinitely; however, more than one should not be simultaneously shorted as the maximum junction temperature will be exceeded.

Note 2: The maximum power dissipation for these devices must be derated at elevated temperatures and is dictated by $T_{J,MAX} - T_A$ and the ambient temperature, $T_A$. The maximum available power dissipation at any temperature is $P_D = (T_{J,MAX} - T_A)/\theta_J$ or the 25°C $P_{D,MAX}$, whichever is less.

Note 3: These specifications apply for $V_S = \pm 15V$ and over the absolute maximum operating temperature range ($T_L \leq T_A \leq T_H$) unless otherwise noted.

Note 4: Refer to RETS 148X for LM148 military specifications and refer to RETS 149X for LM149 military specifications.

Note 5: Human body model, 1.5 kΩ in series with 100 pF.

Cross Talk Test Circuit

Application Hints

The LM148 series are quad low power 741 op amps. In the proliferation of quad op amps, these are the first to offer the convenience of familiar, easy to use operating characteristics of the 741 op amp. In those applications where 741 op amps have been employed, the LM148 series op amps can be employed directly with no change in circuit performance.

The LM149 series has the same characteristics as the LM148 except it has been decompensated to provide a wider bandwidth. As a result the part requires a minimum gain of 5.

**Application Hints**

The LM148 series are quad low power 741 op amps. In the proliferation of quad op amps, these are the first to offer the convenience of familiar, easy to use operating characteristics of the 741 op amp. In those applications where 741 op amps have been employed, the LM148 series op amps can be employed directly with no change in circuit performance.

The LM149 series has the same characteristics as the LM148 except it has been decompensated to provide a wider bandwidth. As a result the part requires a minimum gain of 5.

The package pin-outs are such that the inverting input of each amplifier is adjacent to its output. In addition, the amplifier outputs are located in the corners of the package which simplifies PC board layout and minimizes package related capacitive coupling between amplifiers.

The input characteristics of these amplifiers allow differential input voltages which can exceed the supply voltages. In addition, if either of the input voltages is within the operating common-mode range, the phase of the output remains correct. If the negative limit of the operating common-mode range is exceeded at both inputs, the output voltage will be positive. For input voltages which greatly exceed the maximum supply voltages, either differentially or common-mode, resistors should be placed in series with the inputs to limit the current.

Like the LM741, these amplifiers can easily drive a 100 pF capacitive load throughout the entire dynamic output voltage and current range. However, if very large capacitive loads must be driven by a non-inverting unity gain amplifier, a resistor should be placed between the output (and feedback connection) and the capacitance to reduce the phase shift resulting from the capacitive loading.

The output current of each amplifier in the package is limited. Short circuits from an output to either ground or the power supplies will not destroy the unit. However, if multiple output shorts occur simultaneously, the time duration should be short to prevent the unit from being destroyed as a result of excessive power dissipation in the IC chip.
Application Hints (Continued)

As with most amplifiers, care should be taken with lead dress, component placement and supply decoupling in order to ensure stability. For example, resistors from the output to an input should be placed with the body close to the input to minimize “pickup” and maximize the frequency of the feedback pole which capacitance from the input to ground creates.

A feedback pole is created when the feedback around any amplifier is resistive. The parallel resistance and capacitance from the input of the device (usually the inverting input) to AC ground set the frequency of the pole. In many instances the frequency of this pole is much greater than the expected 3 dB frequency of the closed loop gain and consequently there is negligible effect on stability margin. However, if the feedback pole is less than approximately six times the expected 3 dB frequency a lead capacitor should be placed from the output to the input of the op amp. The value of the added capacitor should be such that the RC time constant of this capacitor and the resistance it parallels is greater than or equal to the original feedback pole time constant.

Typical Applications—LM148

One Decade Low Distortion Sinewave Generator

![Circuit Diagram]

\[ f = \frac{1}{2\pi R1 C1} \times \sqrt{\frac{R4 R5}{R3}} \left( \frac{1}{R4} + \frac{1}{R5} \right) \]

\[ R_{\text{ON}} \approx \frac{V_{\text{GS}}}{V_{\text{P}} \left( 1 - \frac{V_{\text{GS}}}{V_{\text{P}}} \right) \frac{1}{2}} \]

\( f_{\text{MAX}} = 5 \text{ kHz}, \ THD \leq 0.03\% \)

\( R1 = 100k \text{ pot}, \ C1 = 0.0047 \mu F, \ C2 = 0.01 \mu F, \ C3 = 0.1 \mu F, \ R2 = R6 = R7 = 1M, \ R3 = 5.1k, \ R4 = 12k, \ R5 = 24k, \ Q = \text{NS5102}, \ D1 = 1N914, \ D2 = 3.6V \text{ avalanche diode (ex. LM103), V}_{\text{S}} = \pm 15V \)

A simpler version with some distortion degradation at high frequencies can be made by using A1 as a simple inverting amplifier, and by putting back to back zeners in the feedback loop of A3.
Typical Applications—LM148 (Continued)

**Low Cost Instrumentation Amplifier**

\[ V_{\text{OUT}} = 2 \left( \frac{2R}{R_1} + 1 \right), \quad V_S - 3V \leq V_{\text{IN,CM}} \leq V_S + 3V, \]

- \( V_S = \pm 15V \)
- \( R = R_2 \), trim \( R_2 \) to boost CMRR

**Low Drift Peak Detector with Bias Current Compensation**

Adjust \( R \) for minimum drift
- D3 low leakage diode
- D1 added to improve speed
- \( V_S = \pm 15V \)
Universal State-Variable Filter

\[
\begin{align*}
V_{in} & \rightarrow \frac{N(s)}{D(s)} = \frac{S^2}{Q} + \frac{S\omega_0}{Q} + \omega_0^2 \\
N_{HP}(s) & = S^2H_{HP}, \quad N_{LP}(s) = -\frac{S\omega_0H_{LP}}{Q} \\
Q & = \frac{R_3R_5}{R_6} = \left(\frac{1 + R_4R_3 + R_4R_0}{1 + R_5R_6}\right)^2 \\
H_{HP} & = \frac{1 + R_6R_5}{1 + R_3R_0 + R_3R_4} \\
H_{LP} & = \frac{1 + R_3R_0 + R_3R_4}{1 + R_6R_5}
\end{align*}
\]

Tune Q through R0.
For predictable results: \(Q < 4 \times 10^4\)
Use Band Pass output to tune for Q.
Typical Applications—LM148 (Continued)

A 1 kHz 4 Pole Butterworth

- Use general equations, and tune each section separately
- Q_{1st SECTION} = 0.541, Q_{2nd SECTION} = 1.306
- The response should have 0 dB peaking

A 3 Amplifier Bi-Quad Notch Filter

- Ex: f_{NOTCH} = 3 kHz, Q = 5, R_1 = 270k, R_2 = R_3 = 20k, R_4 = 27k, R_5 = 20k, R_6 = R_8 = 10k, R_7 = 100k, C_1 = C_2 = 0.001 µF
- Better noise performance than the state-space approach.
A 4th Order 1 kHz Elliptic Filter (4 Poles, 4 Zeros)

\[ f_C = 1 \text{ kHz}, \quad f_S = 2 \text{ kHz}, \quad f_p = 0.543, \quad f_Z = 2.14, \quad Q = 0.841, \quad Q' = 4.403, \text{ normalized to ripple BW} \]

\[ f = \frac{1}{2\pi R1C1}, \quad f_s = \frac{1}{R4R5 (\frac{1}{R4} + \frac{1}{R5})}, \quad f_{ON} \approx \frac{R_{ON}}{1 - \frac{V_{DS}}{V_{PP}}} \]

Use the BP outputs to tune Q, Q', tune the 2 sections separately

R1 = R2 = 92.6k, R3 = R4 = R5 = 100k, R6 = 10k, R0 = 107.8k, R_L = 100k, R_H = 155.1k,
R'1 = R'2 = 50.9k, R'4 = R'5 = 100k, R'6 = 10k, R'O = 5.78k, R'L = 100k, R'H = 248.12k, R'T = 100k. All capacitors are 0.001 \mu F.
Typical Applications—LM149

Minimum Gain to Insure LM149 Stability

\[ A_{CL}(s) = \frac{V_{OUT}}{V_{IN}} = \frac{-4}{1 + 5\frac{A_{OL}(s)}} = -4 \]

For stability purposes: \( R_7 = \frac{R_6}{4}, \ 10R_6 = R_5, \ C_C = 10C \)

Non-inverting-Integrator Bandpass Filter

\[ Q = \frac{R_5}{R_6} \cdot \frac{R_{IN}}{R_{OUT}} \]

For stability purposes: \( R_7 = \frac{R_6}{4}, \ 10R_6 = R_5, \ C_C = 10C \)

Better Q sensitivity with respect to open loop gain variations than the state variable filter.

R7, Cc added for compensation
Typical Applications—LM149 (Continued)

Active Tone Control with Full Output Swing (No Slew Limiting at 20 kHz)

\[ V_S = \pm 15V, \quad V_{OUT(MAX)} = 9.1 \, V_{RMS} \]

\[ f_{MAX} = 20 \, kHz, \quad THD \leq 1\% \]

Duplicate the above circuit for stereo

\[ f_L = \frac{1}{2\pi R2C1}, \quad f_B = \frac{1}{2\pi R1C1} \]

\[ f_H = \frac{1}{2\pi R5C3}, \quad f_{HB} = \frac{1}{2\pi (R1 + 2R7)C3} \]

Max Bass Gain = \( (R1 + R2)/R1 \)

Max Treble Gain = \( (R1 + 2R7)/R5 \)

as shown: \( f_L = 32 \, Hz, \quad f_B = 320 \, Hz \)

\( f_H = 11 \, kHz, \quad f_{HB} = 1.1 \, Hz \)
Typical Applications—LM149 (Continued)

Triangular Squarewave Generator

\[ f = \frac{K \times V_{IN}}{8V^- C1R1^-} \quad K = \frac{R_2}{R_1^2} \cdot \frac{2V_0}{K} \leq 25V, V^+ = V^-, V_S = \pm 15V \]

Use LM125 for ±15V supply
The circuit can be used as a low frequency V/F for process control.
Q1, Q3: KE4393, Q2, Q4: P1087E, D1–D4 = 1N914
Typical Simulation

LM148, LM149, LM741 Macromodel for Computer Simulation

For more details, see IEEE Journal of Solid-State Circuits, Vol. SC-9, No. 6, December 1974

Note 6: \[ c_1 = 112I_S = 8 \times 10^{-16} \]

Note 7: \[ c_2 = 144^*C_2 = 6 \text{ pF for LM149} \]
