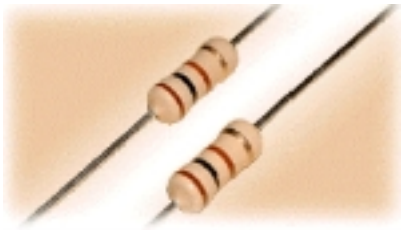
INDEX

CARBON FILM FIXED RESISTORS



Carbon film resistors are the earliest and a still popular type of resistor and carbon film resistors are made by breaking down hydrocarbon gases at high temperature in a vacuum to form a carbon deposit on the surface of a cylindrical substrate. Trimming to value is accomplished by the cutting of spiral grooves. An alternative method of producing carbon film is to mechanically apply carbon “dust” dispersed in a curable polymeric binder. The material is painted on the substrate in a spiral pattern and cured at a moderately elevated temperature. Resistor types include general purpose. Through hole (dip type) and surface mount devices. Also included are specialty types, such as high power, high voltage and fusible resistors. Carbon film resistors also come in nonflammable coating that can withstand high temperature. Token carbon film resistors come with competitive prices and widely used in the electronics, and consumer electrical industries.

METAL FILM RESISTORS

Metal film resistors use nickel-chromium or a similar alloy deposited on a ceramic rod by a vacuum process of evaporation or sputtering. The final resistance value is (most commonly) defined by cutting an insulating path through the film along the length of the rod while keeping it in rotation. This electrically lengthens the resistor by producing a helix current path around the rod from end-to –end. The technology is capable of supporting precision characteristics over a broad resistance range. Resistor types include axial Through Hole through-hole and metal film fusible resistor on special purpose.

METAL OXIDE FILM FIXED RESISTORS

Metal oxide resistors have a resistance element formed by the oxidation reaction of a vapor or spray of tin chloride solution on the heated surface of a glass or ceramic rod. The resulting tin-oxide film is adjusted to value by cutting a helix path through the film. The metal oxide film can Sustain high temperatures and electrical overloads, and supports moderate-to-precision attributes. Resistor types include high power and flameproof axial through hole and surface-mounted devices.

KNP WIRE-WOUND RESISTOR

Wire wound resistor construction consists of a measured length of resistance wire (metal alloy) wound on a core (usually a ceramic). The element assembly is then protected by a coating or enclosure of insulating material (such as: vitreous enamel, silicone, cement, epoxy, etc.). Wire wound Resistors are typically used where large power dissipation is required and where ac performance is relatively unimportant. Token provides wire wound resistors (KNP), and non-inductive wire wound (KNPN).

CEMENT TYPE RESISTORS

Token cement resistors are made by winding resistance wires around non-alkaline ceramic core or metal oxide film rod, which is added with a layer of heat and humidity resistant and non-corrosive protective material. The wire wound resistor is then placed in a square ceramic package sealed with special nonflammable heat-resistant cement. Token. Offers wide range cement type resistors including SQP type, SQM type, SQZ type, and SQH type.

FUSIBLE RESISTORS

Fusible resistors are specially spiraled to provide the fusible function with flame retardant coating. Fusible resistors contain both functions, as being a resistor in normal condition and changed into a fuse while abnormal current comes into the protected PCB or equipments. Token fusible resistors are widely used in constant voltage designed; overload protection, capplicable for battery chargers, TV sets, cordless phones, and PC/CPU coolers. Token provides metal film fusible resistors (FRN), carbon film fusible resistors (FRN), wire wound fusible resistors (FKN), and cement type fusible resistors (FSQ).

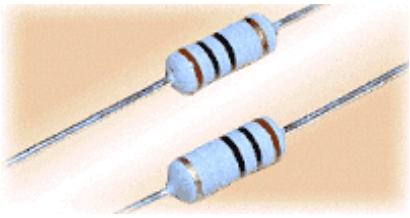
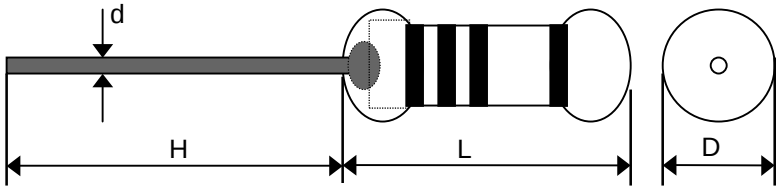
POWER TYPE METAL GLAZE ANTI SURGE RESISTOR (RCR)

Power Type Metal Glaze Anti Surge Resistors (RCR) are made by metal glaze coating on the surface of a cylindrical substrate with excellent anti-surge characteristics and stable at even high resistance range. Token metal glaze anti surge power type resistors come with competitive prices and are widely used in the power source protector like fluorescent's inverter, and starting resistor for Mercury Lamp. For high value resistance application, metal glaze anti-surge resistors are widely used in computer and electronics, like protector of eliminate electrostatic and thunder lightning.





ANTI SURGE RESISTOR GENERAL SPECIFICATION

Type	Power Rating	L	D	H	d±0.05
RCR50	1/2W	9.0±1	3.2±0.5	26±3	0.60
RCR100	1W	110±1	4.0±0.5	26±3	0.8

ANTI SURGE RESISTOR POWER RATING

Type	Power Rating	Max Working Voltage	Max Overload Voltage	Dielectric With-standing Voltage	TCP. (ppm /°C)	Resistance Range E24.J (±5%)	Operating Temp. Range
RCR50	1/2W	700V	1000V	700V	±350	100KΩ~33MΩ	-55°C ~+155°C
RCR100	1W	1000W	1500W	700W	------	------	-----

LOADING CONDITIONS

Surge Voltage	Anti-Surge Characteristics	Surge Test Condition
10KV (R0 >100KΩ)	In accordance with IEC 65 Safety specification.	(2.5 Sec. ON + 2.5 Sec. Off)×10 Cycles ΔR≦10%

THINK FILM CHIP RESISTORS

Token think film chip resistors are formed by vacuum depositing a resistive alloy on a usually flat substrate of ceramic. Photolithographic or similar techniques are used to define the final geometry of the resistors and interconnecting traces. This technology provides for close ratio matching and tracking of resistors in a network, as well as low stand-alone temperature coefficient and resistance tolerance. Resistor types include precision chip resistors (FCR), chip array resistor (RCA), and chip resistor networks (RCN).

THINK FILM CHIP RESISTORS DIMENSIONS

ZERO OHM/JUMPER WIRE RESISTORS

Zero ohms are developed for the interconnection device Between points on a P.C. Board as jumper wires or Crossovers. Token offer a quick solution to the following problems, (1) Inability to connect two points on a P.C. Board due To other circuit paths which must be crossed over. (2) An After the fact design the requires new point connections. (3) Circuit tuning by changing point connections. Zero ohms are especially suited for automatic machine insertion. Token offers zero ohm resistors (ZO) and jumper wire resistors (JW).

RESISTOR COLOR CODE SYSTEM

Token resistor color code system applies to carbon film resistors, metal oxide film resistors, fusible resistors, precision metal film resistors, and wire wound resistors (cylindrical with enlarged ends) of the axial lead type. This system is employed for resistors when the surface area is not sufficient to print the resistance value for the past time. At present, Token resistor color code system is applying for autoimmunization. The first three bands closest to one end of the resistor are used to determine the resistance. The fourth band represents the tolerance of the resistor. Additional information can be obtained from the first band. Generally, If an additional fifth band is black, the resistor is wire wound resistor. If an additional fifth band is white, the resistor is fusible resistor. If only one black band in the center, the resistor is called zero ohm resistor. The colors of the first two bands represent the numerical value of the resistor. The third band represents the power-of-10 multiplier.

HOW TO READ THE REISISTOR CODE

First find the tolerance band, it will typically be gold (5%) and sometimes silver (10%). Starting from the other end, identify the first band - write down the number associated with that color; in this case Red is 2. Now 'read' the next color, here it is red so write down a 2 next to the two. (You should have '22' so far.) Now read the third or 'multiplier' band and write down that number of 1. In this example, the 'multiplier' band is Black so we get 22Ω. If the 'multiplier' band is Gold move the decimal point one to the left. If the 'multiplier' band is Silver move the decimal point two places to the left.

TOKEN RESISTOR GLOSSARY

RATED POWER

The maximum value of power, which can be continuously loaded to a resistor at a rated ambient temperature. Please confirm beforehand that there is such a case in a network resistor that rated power per package as well as per element is specified.

RATED VOLTAGE

The maximum value of D.C. voltage or A.C. voltage (commercial frequency effective value) capable of being applied continuously to a resistor at the rated ambient temperature. Rated voltage shall be calculated from the following formula. However, it shall not exceed the maximum working voltage.

Rated Voltage (V) $=\sqrt{}$Rated Power (W) X Nominal Resistance Value(Ω)

CRITICAL RESISTANCE VALUE

The maximum nominal resistance value at which the rated power can be loaded without exceeding the maximum working voltage. The rated voltage is equal to the maximum working voltage in the critical resistance value.

MAXIMUM WORKING VOLTAGE

The maximum value of D.C. voltage or A.C. voltage (commercial frequency effective value) capable of being applied continuously to a resistor or a resistor element. However, the maximum value of the applicable voltage is the rated voltage at the critical resistance value or lower.

MAXIMUM OVERLOAD VOLTAGE

Specifications given herein may be changed at any time without prior notice. Please confirm technical specifications before you order and/or use. The maximum value of voltage capable of being applied to a resistor for five seconds in the overload test. (JIS C 5201- 1 4.13) Typically the applied voltage in the short time overload test shall be 2.5 times larger than the rated voltage. However, it shall not exceed the maximum overload voltage.

DIELECTRIC WITHSTANDING VOLTAGE

A.C. voltage (commercial frequency effective value) that can be applied to a designated spot between the electrode and the outer coating for a minute in the dielectric withstanding voltage test. (JIS C 5201- 1 4.7)

RATED AMBIENT TEMPERATURE

The maximum ambient temperature at which a resistor is capable of being used continuously with the prescribed rated load (power). The rated ambient temperature refers to the temperature around the resistor inside the equipment, not to the air- temperature outside the equipment.

DERATING CURVE

The curve that expresses the relation between the ambient temperature and the maximum value of continuously loadable power at its temperature, which is generally expressed in percentage.

TEMPERATURE COEFFICIENT OF RESISTANCE (T.C.R.)

The rate of change in resistance value per 1 °C in the prescribed temperature within the range of resistor operating temperature shall be expressed in the following formula:

$$\text{T.C.R. (ppm/°C)} = \frac{R-R_0}{R_0} \times \frac{1}{T-T_0} \times 10^6$$

R：Measured resistance (Ω) at T °C

R_0：Measured resistance (Ω)at T_0°C

T：Measured test temperature (°C)

T_0：Measured base temperature (°C)

PRECAUTIONS IN USE OF FIXED RESISTORS

FIXED RESISTORS IN GENERAL

When an ambient temperature exceeds a rated ambient temperature, resistors shall be applied on the derating curve by derating the load power.
General resistors are not combustion- resistant and are likely to emit, flame, gas, smoke, red heat, etc. under overloads. Flame retardant resistors generally emit smoke and red heat in a certain power and over but do not emit fire or flame.
When resistors are shielded or coated with resin etc., stress from the storage heat and the resin are applied to the resistors. So, performance and reliability of resistors should be checked well before use.
When a voltage higher than rated is applied in a short time (single pulse, repeated pulses, surge, etc.), it does not necessarily ensure safety that an effective wattage is not higher than a rated wattage. Then consult with us with your specified pulse wave shape
Resistors shall be used in a condition causing no dew condensation.
Keep temperature from rising by choosing a resistor with a higher rated capacity; do not use a component having the exact load value required. For considerations of safety in extended period applications, the resistor rating should be more than four times higher than the actual wattage involved, but never use a resistor at less than 25% of its rated power.
In applications where resistors are subject to intermittent current surges and spikes, be sure in advance that the components selected are capable of withstanding brief durations of increased load.
Do not exceed the recommended rated load. Resistors must used within the rated voltage range to prevent the shortening of service life and/or failure of the wound resistance elements
Minimum load: Resistors must be utilized at 1/10 or more of the rated voltage to prevent poor conductance due to oxidation build-up.
For basic particulars for cautions, refer to EIAJ Technical Report RCR- 2121 "Guidance for care note on fixed resistors".

METAL OXIDE FILM RESISTORS

All resistors manufactured by Token Electric Co., Ltd. comply with the U.S. UL-94 non-flammability test, Class V-0, a continuous combustion period of zero seconds.
Smoke emitted from non-flammable resistors on initial use in powered circuits is a normal phenomenon and the component can be safely utilized.
Never use organic solvents to clean non-flammable resistors.
Non-flammable resistors cannot be utilized in oil.
Non-flammable resistor cannot be used in high frequency machinery because of the inductance produced by the windings.
A suitable type of resistor must be selected. Contact us for details.
Although the hardness exceeds that of a 3H pencil lead, do not nick the resistor coating with screwdrivers or other pointed objects
Avoid touching non-flammable resistors in operation; the surface temperature ranges from approximately 350°C to 400°C when utilized at the full rated value. Maintaining a surface temperature of 200°C or less will extend resistor service life.
Less resistant against external shocks than ordinary resistors due to special flame retardant coating. So, never give shocks or vibrations on the resistors. Also never damage them by picking up the coated films with pliers, tweezers, etc. After cleaning, no external power should be put on the coated films before they are well dried.

WIRE WOUND RESISTORS

When being used in AC circuits, some wire wound structures give inductance ingredients or parasitic capacity, so they may cause unusual phenomena such as oscillations etc.
Quorum deviations of other components should be carefully taken into account for use.
Application and Placement: Wire-wound resistors use different gauges of wire as resistance elements. Sometimes the gauge is extremely thin (finer than a strand of human hair) and very susceptible to breakage in environments containing salts, ash, dust and corrosives. Avoid utilization in such environments.
Do not install in dusty areas because the accumulation will cause shorts and poor conductance.

FUSING RESISTORS

When using, it shall be made sure that the overload conditions at unusual moments lie within the fusing territory.
Consult with us in advance when overloaded higher than the rated voltage under an ordinary situation since such an overload may store up damages on resistors.
Use at the maximum open- circuit voltage or lower as an arc phenomenon may arise when high voltage is applied again after fusing by an over current.
Consult with us for the maximum open- circuit voltage because it varies with type and resistance.

CHIP NETWORKS

Care should be taken to the fact that slipping out of position during mounting may increase to cause solder bridges.
As chip networks receive mechanical stress easier than chip resistors, take care so that no strong mechanical stress is given during and after the mounting.
An incorrect solder volume increases stress on resistors and may result in cracks or performance defects. Be careful to avoid too much or too little soldered volume

PRECAUTIONS IN USE

The types and the specifications in this catalog are typical ones. Before use, please make sure of specifications and precautions in use with the contents of specifications for supply or ask our sales offices for the specifications.

PARTICULARS COMMON TO ALL KINDS OF PRODUCT TYPES

APPLICATIONS

When components are used for special applications requiring high reliability (life maintenance equipment, atomic energy, airplanes, artificial satellites, etc.), contact us beforehand. Also make sure to evaluate and verify the components in a state that they are mounted on actual equipment.

SOLDERING

Soldering shall be performed within the specified temperature, time and number of times for each component. If the components are heated to high temperature for a long time, the colors and characteristics may change, and disconnection may occur.
After soldering, keep the component from stress until it is cooled down.
After soldering, be sure not to give any mechanical stress on the terminal section by warping of the printed board, etc.

INSERTION AND MOUNTING

The coating is covered to ensure the performance of components. Do not give any damages or excessive impacts on the products with pliers or pinsetter, or improper adjustment of an automatic mounter.
They may cause characteristic changes, disconnection, crack, etc.
Do not use the components dropped at the time of mounting or ones removed from the printed boards.
Make sure to avoid heat radiation generated by other heated components.
In case boards are sealed by molding or coated after mounting components, consult us beforehand.
Take care not to have electrostatics applied to the components when assembling.

RESISTANCE TO PULSE

If the components are used in circuits where pulse wave current (single pulse, repeated pulse) or surge current flows, consult us beforehand.
Also note that it is necessary to check with actual circuits considering dispersion of the tolerance values of the other components.

STORAGE

The components should be kept away from high temperature, high humidity, direct sunlight, heat, corrosive gas (brimstone, chlorine, acid, alkali, etc.)
Please inquire us about the storage term of products.

CLEANING

Be careful not to leave ionic substances contained in solder flux after washing the flux.
Especially when non-washing- soldering, water washing or water- soluble detergent is used, it is essential to confirm reliability of the components before use.

GENERAL

For basic particulars for cautions, refer to EIAJ Technical Report RCR-1001 “Safety application guide for electronic parts ”.

PARTICULARS COMMON TO CHIP COMPONENTS

Warping of printed boards, which is caused by heat, gives stress directly to components when boards are cooled down. Be careful of the following particulars:
The arrangement of electrodes of chip components should go along with the fiber direction (vertical direction) of printed boards.
When printed boards are divided after soldering, proper positioning of the components is required in order to avoid any stress caused by warping, bending, etc. of the boards.
Be sure to design the same size of pads both on left and right sides.
If far different sizes of components are mixed on a board, take care of the positioning of the components.

PARTICULARS COMMON TO DISCRETE COMPONENTS

To avoid mechanical force to components, pay attention to following the particulars:
Be careful not to create resonance by vibration.
The bodies of the discrete components should be free from twisting or bending.
The bodies of the large components should be firmly fixed.
When the lead wires need to be bent, try to make larger radius of curve in order to avoid excessive force at the foot of the terminals.
When cutting or clinching the lead wires on the mounter, be careful not to apply excessive forces to them.
